

# Constructed, Augmented MaxDiff

EARL London

September 13, 2018

**Chris Chapman** Principal Researcher, Google

**Eric Bahna** Product Manager, Google

# Overview

We often have lists of things we want customers to prioritize:

- Feature requests

- Key needs

- Product messaging

- Use cases and scenarios

- Generally, preferences amongst any set of things

# Overview

We often have lists of things we want customers to prioritize:

- Feature requests

- Key needs

- Product messaging

- Use cases and scenarios

- Generally, preferences amongst any set of things

We discuss how to do this systematically ...

... with shared R code, and modern Bayesian methods under the hood!

# Problem: Sparse, local data vs. global prioritization

	FR1	FR2	FR3	FR4	FR5	FR6
CustomerA	P1	P1		P1		
CustomerB		P0				
CustomerC			P1			
CustomerD					P1	

We want this ...

Rank	Feature	Priority
1	FR4	P0
2	FR5	P0
3	FR6	P1
4	FR1	P1
5	FR3	P2
6	FR2	P2

# Dense, global data → global prioritization decisions

	FR1	FR2	FR3	FR4	FR5	FR6
CustomerA	P1	P1		P1		
CustomerB		P0				
CustomerC			P1			
CustomerD					P1	

	FR1	FR2	FR3	FR4	FR5	FR6
CustomerA	16	11	17	21	24	11
CustomerB	26	2	8	25	12	27
CustomerC	5	15	6	42	23	9
CustomerD	3	11	8	28	23	27

PMs

Rank	Feature	Priority

2	FR5	P0
3	FR6	P1
4	FR1	P1
5	FR3	P2
6	FR2	P2

# Rating scales don't work very well

Analysts often try to solve this problem with a rating scale:

## How important is each feature?

	<i>Not at all</i>	<i>Slightly</i>	<i>Moderately</i>	<i>Very</i>	<i>Extremely</i>
Feature 1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Feature 2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Feature 3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Feature 4	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Feature 5	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# Rating scales don't work very well

Analysts often try to solve this problem with a rating scale:

## How important is each feature?

	<i>Not at all</i>	<i>Slightly</i>	<i>Moderately</i>	<i>Very</i>	<i>Extremely</i>
Feature 1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Feature 2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Feature 3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Feature 4	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Feature 5	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**What's the problem?** ⇒ No user cost: I can rate "everything is important!"  
⇒ Not all "important" things are equally important

*Common result: hard to interpret!*

	<b><i>Average Importance</i></b>
Feature 1	4.6
Feature 2	4.3
Feature 3	4.4
Feature 4	4.8

# Initial Solution: MaxDiff discrete choice survey

- Ask respondents to make **forced-choice tradeoffs** among features
- Repeat multiple times with **randomized** sets.
- Estimate a **mixed effects model** for overall and per-respondent preference

Considering just these 4 features, which one is **most important** for you? Which one is **least important**?

	Most Important	Least Important
<b>i13</b> description	<input type="radio"/>	<input type="radio"/>
<b>i16</b> description	<input type="radio"/>	<input type="radio"/>
<b>i34</b> description	<input type="radio"/>	<input type="radio"/>
<b>i9</b> description	<input type="radio"/>	<input type="radio"/>

# Concerns with Initial MaxDiff

## ***Data Quality & Item relevance:***

Enterprise respondents are often specialized; can't prioritize all items.

## ***Respondent survey experience:***

Length of survey is proportional to number of items. Shorter is better!

# Concerns with Initial MaxDiff

*Data Quality & Item relevance:*

Enterprise respondents are often specialized; can't prioritize all items.

*Respondent survey experience:*

Length of survey is proportional to number of items. Shorter is better!

## **Solution:**

**Construct** the MaxDiff list per respondent for what interests them.

Optionally **augment** the data file with inferred preferences.

⇒ Shorter surveys, better targeted, better differentiation of high priority items

⇒ "**Constructed, Augmented MaxDiff**" (CAMD).

*[We admit it, not so catchy.]*

# Constructed Augmented MaxDiff (CAMD)

# CAMD Adds Two Questions Before MaxDiff

## “Relevant?”

	I have visibility into this feature's importance	I do not have visibility into this feature's importance.
i24	<input type="radio"/>	<input type="radio"/>
description		
i27	<input type="radio"/>	<input type="radio"/>
description		
i8	<input type="radio"/>	<input type="radio"/>
description		
i12	<input type="radio"/>	<input type="radio"/>
description		
i21	<input type="radio"/>	<input type="radio"/>

⋮

**Yes** → Add to *constructed* list

## “Important at all?”

	At least somewhat important	Not important
i9	<input type="radio"/>	<input type="radio"/>
description		
i13	<input type="radio"/>	<input type="radio"/>
description		
i4	<input type="radio"/>	<input type="radio"/>
description		
i24	<input type="radio"/>	<input type="radio"/>
description		
i29	<input type="radio"/>	<input type="radio"/>
description		
At least		

⋮

**No** → Use to *augment* data, saving time

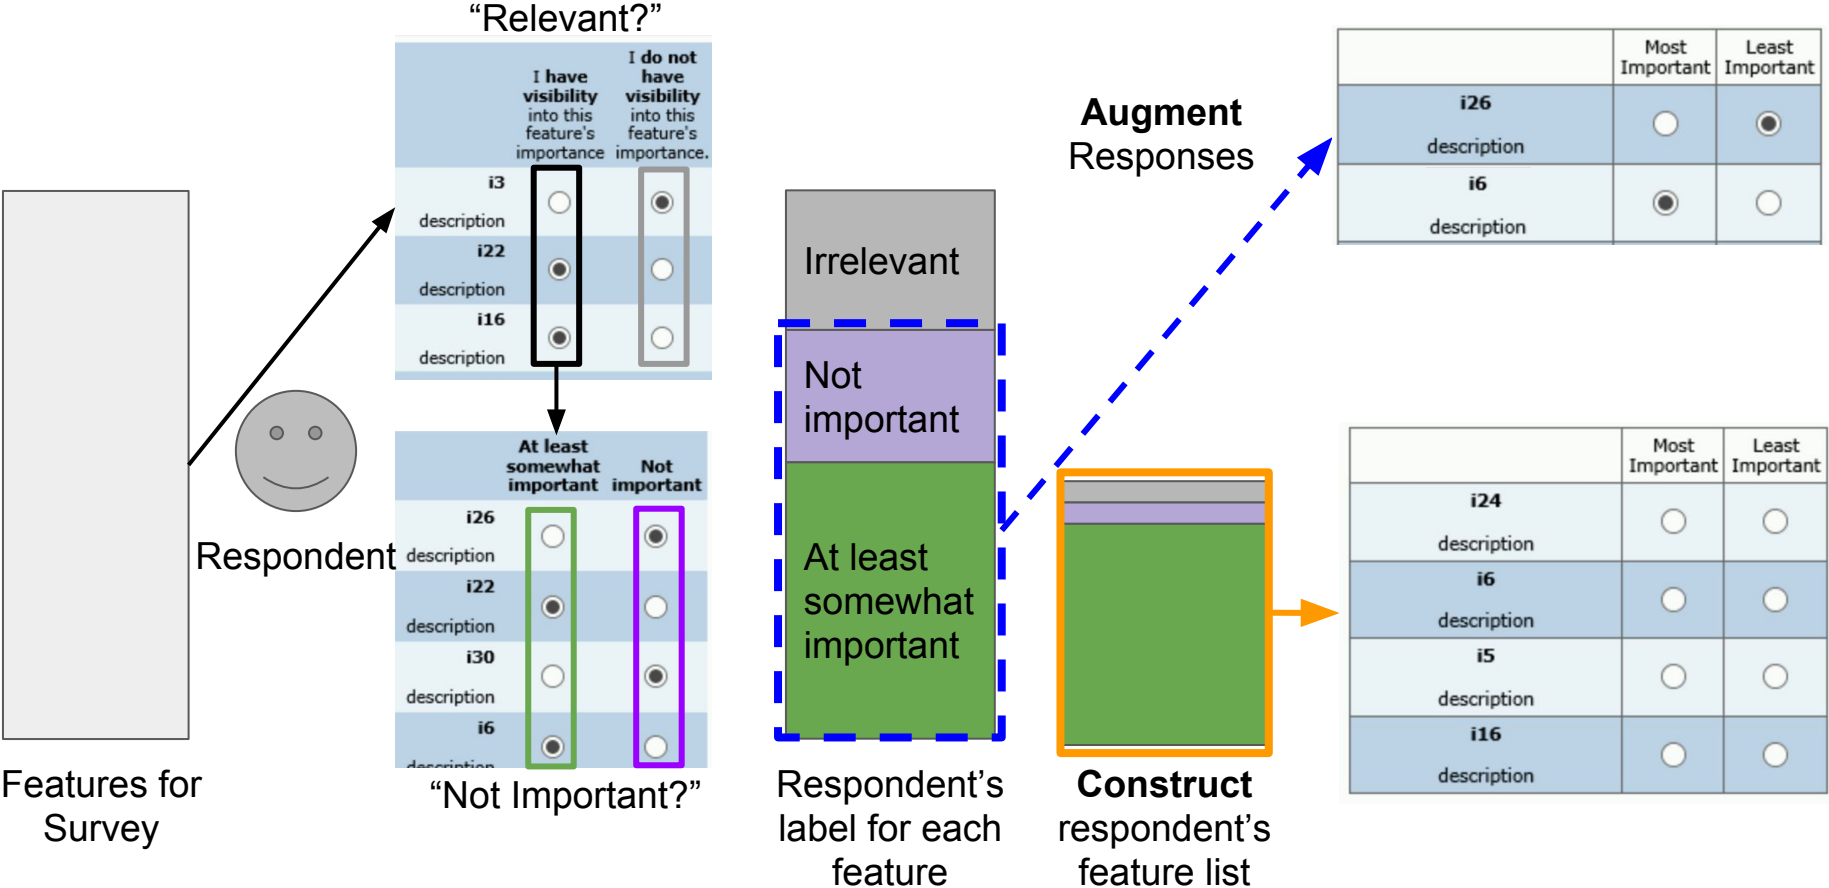

## “Most & Least Important?”

	Most Important	Least Important
i13	<input type="radio"/>	<input type="radio"/>
description		
i16	<input type="radio"/>	<input type="radio"/>
description		
i34	<input type="radio"/>	<input type="radio"/>
description		
i9	<input type="radio"/>	<input type="radio"/>
description

MaxDiff uses the constructed list of items

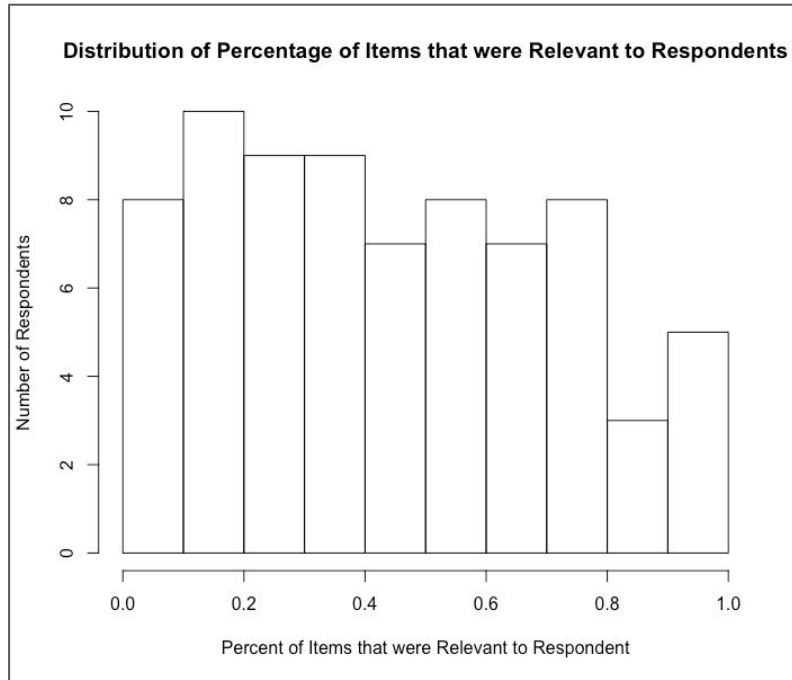

# CAMD Flow

Results: Enterprise Feature Study

(items disguised)

# Results: 55% of Items Irrelevant to Median Respondent

⇒ Huge time cost & dilution of data with noise if we ask about irrelevant items

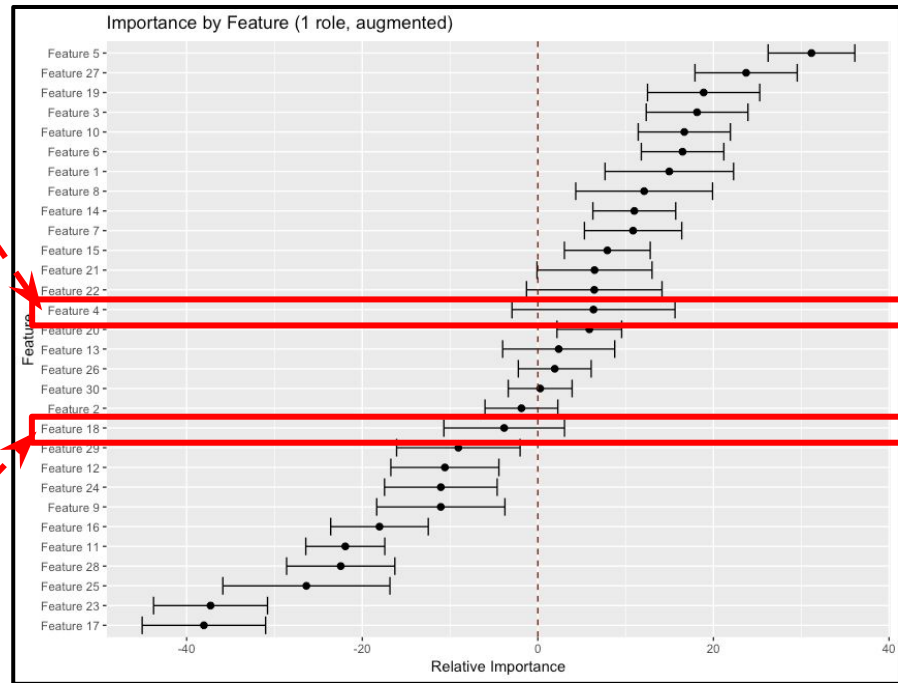

# Results: Before & After Augmentation

Before Augmentation

After Augmentation

⇒ Modest changes; a few items change a lot, most don't. Good to use all the data!

# Results: Changes in Business Priorities

Consider feature "i6" ...

Among 35 features, it was **#35 in engineering cost** to implement

# Results: Changes in Business Priorities

Consider feature "i6" ...

Among 35 features, it was #35 in engineering cost to implement

... and now we learn that it is **#2 in overall customer priority.**

⇒ Much better coverage of customers' priorities, for a given amount of engineering resources

# Results: Respondent and Executive Feedback

- Respondent feedback
  - “Format of this survey feels much **easier**”
  - “**Shorter** and **easier** to get through.”
  - “this time around it was a lot **quicker**.”
  - “Thanks so much for implementing the 'is this important to you' section! **Awesome** stuff!”
- Executive support
  - Funding for internal tool development
  - Advocacy across product areas
  - Support for teaching 10+ classes on MaxDiff, >100 Googlers
- Surprise: many colleagues interested for internal use cases

# R Code

Referenced functions available at [goo.gl/oK78kw](https://goo.gl/oK78kw)

# Features of the R Code

**Data sources:**    Sawtooth Software (CHO file)            ⇒ Common format in R  
                         Qualtrics (CSV file)                ⇒ Common format in R

*Given the common data format*

**Estimation:**        Aggregate logit (using `mlogit`)  
                         Hierarchical Bayes (using `ChoiceModelR`)

**Augmentation:**    Optionally augment data for "not important" implicit choices

**Plotting:**            Plot routines for aggregate logit & upper- & lower-level HB

## Example R Code: Complete Example

[illegible]

# Example R Code, Part 1: Data

```
> md.define.saw <- list(                                     # define the study, e.g.:
  md.item.k          = 33,                                   # K items on list
  md.item.tasks       = 10,                                   # num of tasks
  ... )

> test.read <- read.md.cho(md.define.saw)                   # convert Sawtooth CHO file
Reading CHO file: MaxDiffExport/MaxDiffExport.cho
Done. Read 407 total respondents.

> md.define.saw$md.block <- test.read$md.block             # save the data
```

# Example R Code, Part 2: Augmentation

```
> md.define.saw$md.block <- test.read$md.block      # save the data
> test.aug <- md.augment(md.define.saw)             # augment the choices
Reading full data set to get augmentation variables.
Importants: 493 494 495 496 497 498 499 ...
Unimportants: 592 593 594 595 596 597 ...
Augmenting choices per 'adaptive' method.
Rows before adding: 40700

Augmenting adaptive data for respondent:
6  augmenting: 29 16 25 20 23 9 22 12 5 27 6 11 10 4 26 1 15 2 14 24 31 7 30
13 18 19 3 8 28 21 32 %*% 33 17 ...

Rows after augmenting data: 148660                                # <== 3X data, 1x cost!

> md.define.saw$md.block <- test.aug$md.block      # update data with new choices
```

# Example R Code, Part 3: HB

```
> md.define.saw$md.block <- test.aug$md.block      # update data with new choices
```

```
> test.hb <- md.hb(md.define.saw, mcmc.iters=50000)  # HB
```

MCMC Iteration Beginning...

Iteration	Acceptance	RLH	Pct. Cert.	Avg. Var.	RMS	Time to End
100	0.339	0.483	0.162	0.26	0.31	83:47
200	0.308	0.537	0.284	0.96	0.84	81:50 ...

```
> md.define.saw$md.hb.betas.zc <- test.hb$md.hb.betas.zc  # zero-centered diffs
```

# Example R Code: Plots

```
# upper-level  
> plot.md.range(md.define.saw,  
                item.disguise=TRUE)  
  
# lower-level  
# note we can add ggplot2 functions  
> plot.md.indiv(md.define.saw,  
                item.disguise=TRUE) +  
  theme_minimal()
```

# Conclusions

- Higher quality data
  - Respondents are asked for input on more items that are relevant to them
- More data
  - We observed 2.0 - 3.5x as many implicit choice tasks with augmented data
- Happier respondents
  - MaxDiff items were more relevant to users
  - We asked fewer MaxDiff questions because we could augment the data
- Use the code! [goo.gl/oK78kw](https://goo.gl/oK78kw)

**Thank you!**

Constructed, Augmented MaxDiff: [camd@google.com](mailto:camd@google.com)

# Appendix: Additional findings

# Some other MaxDiff Options

- Adaptive MaxDiff (Orme, 2006):  
Tournament-style selection of items. More complex to program, less focused at beginning of survey. By itself, doesn't solve "I don't do that."
- Express MaxDiff (Wirth & Wolfrath, 2012):  
Selects subset of items to show each respondent. No insight at individual level on non-selected items. Addresses a different problem (long item list).
- Sparse MaxDiff (Wirth & Wolfrath, 2012):  
Uses all items from a long list per respondent, with few if any repetitions across choices. Low individual-level precision. Addresses long item lists.
- Bandit MaxDiff (Sawtooth Software, 2018):  
Focuses increasing attention on most-preferred items, based on previous choices. Addresses survey length concerns.

# Results: Utilities Before and After Augmentation

- Modest adjustments to utilities
- Pearson's  $r = 0.90$  between augmented and non-augmented utilities in one study
- Interesting that utilities became more compressed

# Results: 50% More “Important” Items in MaxDiff

- Constructed MD study:
  - 30 items in survey
  - 20 items in MaxDiff exercise
- Without construction, we'd randomly select 20 of 30 items into MaxDiff exercise
- With construction, we emphasize “important” items

# Appendix:

## Additional Discussion and Design Recs

# Design Recommendations

- Initial rating for entire list of items, used to construct MaxDiff list

**Risk:** Difficult to answer long list of "what's relevant"

**Solution:** Break into chunks; ask a subset at a time; aggregate  
Could chunk within a page (as shown), or several pages.

- Construction of the MaxDiff list

**Risk:** Items might be never selected  $\Rightarrow$  degenerate model

**Solution:** Add 1-3 random items to the constructed list  
We used: 12 "relevant and important to me" +  
1 "not relevant to me" + 2 "not important"  
 $\Rightarrow$  MaxDiff design with 15 items on constructed list

	I have visibility into this feature's importance	I do not have visibility into this feature's importance.

# Open Topics

- **If respondents select the items to rate, what does "population" mean?**  
Carefully consider what "best" and "worst" mean to you.  
*Want:*        share of preference among **overall population**?     $\Rightarrow$  don't construct  
                  ... *or:* share of preference among **relevant subset**?     $\Rightarrow$  construct
- **Appropriate number of items -- if any -- to include randomly to ensure coverage**  
We decided on 1 "not relevant" and 2 "not important", but that is a guess.  
*Idea:* Select tasks that omit those items, re-estimate, look at model stability.
- **Best way to express the "*Relevant to you?*" and "*Important to you?*" ratings**  
This needs careful pre-testing for appropriate wording of the task.
